

A primary focus of this Little Library is to enhance the communities interaction with its form and provide opportunities for motion, repose, and creative thought. The operation for accessing the books is much like that of opening a book; the book cases are grasped and slowly rotated open to reveal the books inside. The vertical fins are much like the pages of a book, when bound together provide rigidity unifying the entire structure, and when approached from the front begin to reveal the texts within. Upon further exploration the user can find the benches that are contained within the base of the Little Library. The benches slide easily out of the base to provide a perfect location for rest, conversation or indulgence in the book of your choice.

BIBLIOTECA

The little library will be milled from 4 x 8 sheets of recycled plywood sheets joined together by 1/2" all-thread rod with a washer and nut assembly on each end. The milled profiles of the little library are designed to maximize the useable area of the 4 x 8 sheet and minimize waste. The shelving units that will store the books will be constructed with aluminum sheet metal with a translucent UV resistant acrylic window panel to provide better visibility of the books as well as increased protection from the sun's rays. The book cases will pivot on a custom piano hinge that runs the entire height of the unit. A UV resistant acrylic sheet lines the interior of the plywood frames and protect the book cases within.

- All-thread rod
- U.V. resistant frosted acrylic sheet
- Marine grade plywood frame
- U.V. resistant frosted acrylic sheet
- Brushed aluminum book case
